Download Starter Application

<https://playframework.com/download#starters>

Play Starter Projects

New to Play? See the starter projects!

If you've never used Play before, download a starter project. The starter projects have lots of comments explaining how everything works and have links to documentation that goes more in depth.

If you download and unzip the .zip file below, you'll see the `sbt` file -- this is a packaged version of `sbt`, the build tool that Play uses.

Type the following at the prompt and it will run the starter project:

```
./sbt run
```

If you type `./sbt` by itself, then you can run it in [interactive mode](#) -- see [Using the Play Console](#) for more detail of how to run Play and the [sbt documentation](#) for more about SBT.

Please see the [documentation](#), chat with the [community](#), and check out the [tutorials](#) for more examples and blog posts!

      play-java-starter-example/project
[info] Loading settings from build.sbt ...
[info] Set current project to play-java-starter-example (in
      build file:/home/rene/play/play-java-starter-example/)

--- (Running the application, auto-reloading is enabled) ---

[info] p.c.s.AkkaHttpServer - Listening for HTTP on
      /0:0:0:0:0:0:0:0:9000

(Server started, use Enter to stop and go back to the console...)
```

Your new application is ready.

Welcome to Play

Congratulations, you've just created a new Play application. This page will help you with the next few steps.

You're using Play 2.6.11

Why do you see this page?

The `conf/routes` file defines a route that tells Play to invoke the `HomeController.index` action whenever a browser requests the `/` URI using the GET method:

```
# Home page
GET      /                controllers.HomeController.index
```

Play has invoked the `controllers.HomeController.index` method:

```
public Result index() {
    return ok(index.render("Your new application is ready."));
}
```

Browse

- [Documentation](#)
- [Browse the Java API](#)

Start here

- [Using the Play console](#)
- [Setting up your preferred IDE](#)
- [Example Projects](#)

Help here

- [Stack Overflow](#)
- [Mailing List](#)
- [Gitter Channel](#)

Step 1: Add the sbteclipse Plugin

Open `project/plugins.sbt`, add two lines:

```
// Eclipse plugin, see https://github.com/typesafehub/sbteclipse
addSbtPlugin("com.typesafe.sbteclipse" % "sbteclipse-plugin" % "5.2.4")
```

Step 2: Generate Eclipse Files

Run `sbt eclipse` (must be done *after* compile!)

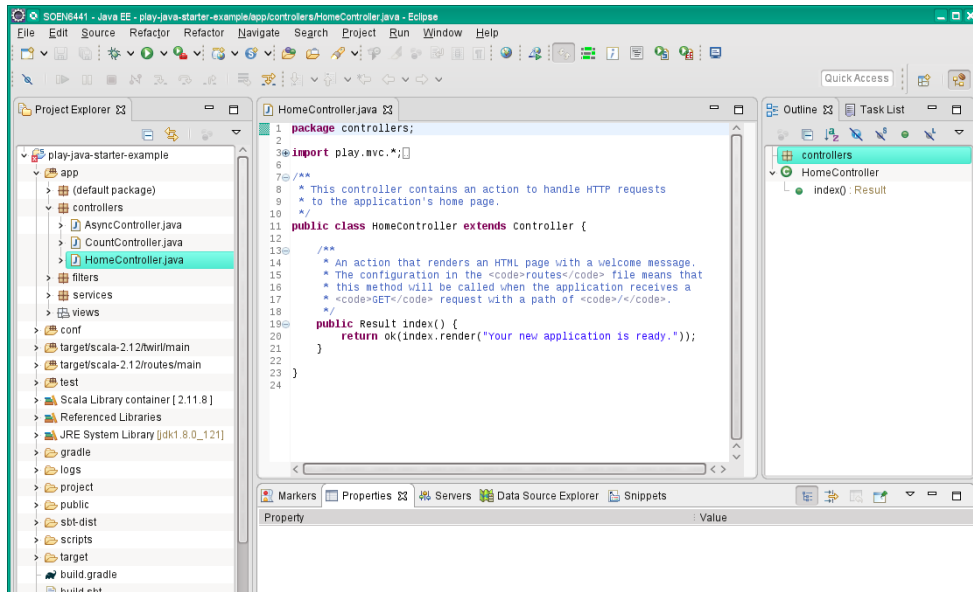

```
rene@matrix:~/play/play-java-starter-example> ./sbt eclipse
[info] Loading settings from plugins.sbt ...
...
[info] About to create Eclipse project files for your project(s).
...
[info] Successfully created Eclipse project files for project(s):
[info] play-java-starter-example
```

See <https://www.playframework.com/documentation/2.6.x/IDE>

Creating an Eclipse Project (II)

Step 3: Import Project into Eclipse Workspace

Choose *File* → *Import* (General/Existing project); select Play starter project directory

Observer

Type: Behavioral

What it is:

Define a one-to-many dependency between objects so that when one object changes state, all its dependents are notified and updated automatically.

Observer Pattern Implementation

René Witte

Observer Interface

```
interface Observer {  
    void notify(String tweet);  
}
```

Observer Pattern Implementation (II)

Implementing Observers

```
class NYTimes implements Observer{
    public void notify(String tweet) {
        if(tweet != null && tweet.contains("money")) {
            System.out.println("Breaking_news_in_NY!" + tweet);
        }
    }
}

class Guardian implements Observer{
    public void notify(String tweet) {
        if(tweet != null && tweet.contains("queen")) {
            System.out.println("Yet_another_news_in_London..." + tweet);
        }
    }
}

class LeMonde implements Observer{
    public void notify(String tweet) {
        if(tweet != null && tweet.contains("wine")) {
            System.out.println("Today_cheese,_wine_and_news!" + tweet);
        }
    }
}
```

Subject Interface

```
interface Subject {  
    void registerObserver(Observer o);  
    void notifyObservers(String tweet);  
}
```

Subject Implementation

```
class Feed implements Subject {  
  
    private final List<Observer> observers = new ArrayList<>();  
  
    public void registerObserver(Observer o) {  
        this.observers.add(o);  
    }  
  
    public void notifyObservers(String tweet) {  
        observers.forEach(o -> o.notify(tweet));  
    }  
}
```

Observer Pattern Implementation (V)

René Witte

[Introduction](#)

[Play 101](#)

[Your First Play Application](#)

[Compiling](#)

[Running](#)

[Using Eclipse](#)

[Model-View-Controller](#)

[Observer Design Pattern](#)

[MVC](#)

[A Play Application](#)

[Application Layout](#)

[HTTP Requests](#)

[Routes](#)

[Controllers](#)

[Asynchronous Results](#)

[Testing](#)

[Unit Tests](#)

[Functional Tests](#)

[Integration Tests](#)

[Notes and Further Reading](#)

Demo application

```
Feed f = new Feed();  
f.registerObserver(new NYTimes());  
f.registerObserver(new Guardian());  
f.registerObserver(new LeMonde());  
f.notifyObservers("The_queen_said_her_favourite_course_is_SOEN6441!");
```

Using lambdas

```
f.registerObserver((String tweet) -> {  
    if(tweet != null && tweet.contains("money")) {  
        System.out.println("Breaking_news_in_NY!_" + tweet);  
    }  
});
```

```
f.registerObserver((String tweet) -> {  
    if(tweet != null && tweet.contains("queen")) {  
        System.out.println("Yet_another_news_in_London..." + tweet);  
    }  
});
```

Model-View-Controller (MVC)

Model

Application classes, typically under `models/`

- E.g., products in a web shop
- Typically connected to a DB layer (e.g., using Ebean)

(please do not confuse *models* with *modules*, which are used for dependency injection)

View

Views, typically under `views/`

- either application-generated, or through a library
- Play supports view templates (e.g., to show a product in a web shop)

Controller

Controllers, in `controllers/`

- Event-handling (HTTP requests)
- Execute [actions](#) that return a result (HTTP response)

```
@*
* This template takes a single argument, a String containing a
* message to display.
*@
@(message: String)

@*
* Call the 'main' template with two arguments. The first
* argument is a 'String' with the title of the page, the second
* argument is an 'Html' object containing the body of the page.
*@
@main("Welcome to Play") {
  @*
  * Get an 'Html' object by calling the built-in Play welcome
  * template and passing a 'String' message.
  *@
  @welcome(message, style = "java")
}
```

Routes configuration

Defined in `conf/routes`

```
# Routes
# This file defines all application routes (Higher priority routes first)
# ~~~~

# An example controller showing a sample home page
GET      /                controllers.HomeController.index

# An example controller showing how to use dependency injection
GET      /count           controllers.CountController.count

# An example controller showing how to write asynchronous code
GET      /message         controllers.AsyncController.message

# Map static resources from the /public folder to the /assets URL path
GET      /assets/*file    controllers.Assets.versioned(path="/public", file: Asset)
```

Play Controllers

- Class extending `play.mvc.Controller`
- Contains several **action** methods
- Returns `play.mvc.Result`

[Introduction](#)[Play 101](#)

Your First Play Application
Compiling
Running
Using Eclipse

[Model-View-Controller](#)

Observer Design Pattern
MVC

[A Play Application](#)

Application Layout
HTTP Requests
Routes

[Controllers](#)

Asynchronous Results

[Testing](#)

Unit Tests
Functional Tests
Integration Tests

[Notes and Further Reading](#)

Example Controller

```
package controllers;

import play.mvc.*;
import views.html.*;

/**
 * This controller contains an action to handle HTTP requests
 * to the application's home page.
 */
public class HomeController extends Controller {

    /**
     * An action that renders an HTML page with a welcome message.
     * The configuration in the <code>routes</code> file means that
     * this method will be called when the application receives a
     * <code>GET</code> request with a path of <code>/</code>.
     */
    public Result index() {
        return ok(index.render("Your_new_application_is_ready."));
    }
}
```

Helper class `play.mvc.Results`

```
Result ok = ok("Hello_world!");
```

```
Result notFound = notFound();
```

```
Result pageNotFound  
    = notFound("<h1>Page_not_found</h1>").as("text/html");
```

```
Result badRequest  
    = badRequest(views.html.form.render(formWithErrors));
```

```
Result oops = internalServerError("Oops");
```

```
Result anyStatus = status(488, "Strange_response_type");
```

Introduction

Play 101

Compiling

Running

Using Eclipse

Model-View-Controller

Observer Design Pattern

MVC

A Play Application

Application Layout

HTTP Requests

Routes

Controllers

Asynchronous Results

Testing

Unit Tests

Functional Tests

Integration Tests

Notes and Further Reading

```
public Result index() {  
    return redirect("/user/home");  
}  
  
public Result index() {  
    return temporaryRedirect("/user/home");  
}
```

Using CompletionStage<Result>

```
CompletionStage<Double> futurePIValue = computePIAsynchronously();  
// thenApply runs in same thread  
CompletionStage<Result> futureResult = futurePIValue.thenApply(  
    pi -> ok("PI_value_computed:_ " + pi)  
);
```

Note

Only the "`*Async`" methods from `CompletionStage` provide asynchronous execution (in a different thread).

See <https://www.playframework.com/documentation/2.6.x/JavaAsync>
